

1. An Ultrasound System for Measuring Cardiac Output

2. System Overview

2.1. Physiology

2.2. Acoustics

2.3. Timing

2.4. Transducer

2.5. Transceiver

2.6. Signal processing

2.7. Data Display

3. Transducer

3.1. Transducer Overview

3.2. Frequency Response

3.2.1. Individual Transducer Element Physical Data

3.2.2. Vector Impedance - Individual Transducer Elements

3.2.3. Vector Impedance - Transducer Element Constellation

3.2.4. Vector Impedance - Element Constellation plus Transformer

3.2.5. Transducer Assembly Isolation Transformer Measured Data

3.2.6. Transducer Assembly Coaxial Cable Measured Data

3.2.7. Vector Impedance - Full Assembly

3.2.8. Input Network Transformer Measured Data

3.2.9. Vector Impedance - Full Assembly Plus Input Network Transformer

3.2.10. Transducer Swept Frequency Pulsed Echo Measurements

3.2.11. Preliminary Single Element Plus Faceplate, Transformer & Cable Computer Model

3.3. Ultrasound Beam Geometry - Single Element

3.4. Ultrasound Beam Geometry - Annular Constellation of Elements

3.4.1.1. Beam Geometry - Computer Model - Set up

3.4.1.2. Beam Geometry - Computer Model - Sanity Check

3.4.1.3. Beam Geometry - Computer Model - On Axis Results

3.4.1.4. Beam Geometry - Computer Model - Off Axis Results

3.4.1.5. Beam Geometry - Scanning Tank Measured Data

3.5. Conclusions and Recommendations

4. Transceiver

- 4.1. Transceiver Overview
- 4.2. Input Network
- 4.3. Transmitter
- 4.4. Receiver
 - 4.4.1. Preamplifier
 - 4.4.2. Variable Gain Amplifier
 - 4.4.3. Automatic Gain Control Loop
 - 4.4.4. Signal Demodulator
 - 4.4.5. Post Amplifier
- 4.5. Circuit Design Issues
- 4.6. PCB Layout Issues
- 4.7. Shielding Issues

5. System Timing

- 5.1. System Timing Overview
 - 5.2. Frequency of Operation
 - 5.3. Provision for balanced signal demodulation
 - 5.4. Separation of CPU and Ultrasound Board Timing Generation
 - 5.5. Mach Chip Internal Program Information
- 4.6 Conclusions and Recommendations
